

Water Resiliency Plan Initiative Activities

GoldSim Model Development Update

Water Resources and Watershed Committee

April 13, 2022

Item No. 6.2

Outline

- Introduction
- Modeling Methodology
- Key Operating Strategies
- Input and Output
- User Interface
- Future Development/Applications

Introduction

- SCV Water has been using an Excelbased Water Resources Model to:
 - Assess the reliability of its supplies.
 - Evaluate the need for new investments.
- The Excel model uses an annual time step, but water resources decisions occur at a finer timescale.
- Currently transitioning to the GoldSim platform, with a monthly time step.

Introduction

- The logic built into the GoldSim model assumes no foresight on State Water Project Allocations.
- The model makes decisions every time step based on assumptions, rules, and thresholds we set.
- Refinements to logic and assumptions will be made during QA/QC.

Modeling Methodology

- Similar to the existing model, the approach used in the new GoldSim model assesses how different supplies are used to meet monthly demand over wet and dry year sequences.
- The analysis simulates the wet and dry year sequences based on the same monthly historic hydrologic record used in CalSim.

Modeling Methodology

- For each hydrologic trace, the model steps through each year of the study period, comparing annual supplies to demands and operating storage and exchange programs as needed.
 - In years when supplies are greater than demands, water is added to storage programs.
 - In years when supplies are less than demands, water is taken from storage.

Modeling Methodology: Water Operations in a Single Year

Modeling Methodology

- Study period results from the number of hydrologic traces used are summarized to provide a statistical assessment:
 - Of the reliability of SCV Water's supplies and storage programs.
 - To evaluate and compare the benefits of different investments for maintaining water supply reliability.

Key Operating Strategies

 Extend the life of each storage program by balancing the stored water to take ratio

10,000 AF is needed from storage

Key Operating Strategies

• Management of storage in San Luis Reservoir

Model Input and Output

INPUT

- Demand Forecast
- State Water Project Supplies
- Local Groundwater
- Recycled Water
- Banking and Exchange Programs

Model Input and Output

<u>OUTPUT</u>

- Probability and exceedance graphs for different variables:
 - Water Supply Reliability
 - Status of Water Balance in Banking Programs
 - Status of Article 56 supplies in San Luis Reservoir
- Tables that can be exported to excel for further analysis

GoldSim - SCV Water_v31*
